ABSTRACT

10 A method, computer program product and system for rendering soft shadows in an
image or frame representing a 3D scene, comprising the steps, from a light's point of
view, of detecting and creating a list of edges casting shadows, a list of soft shadow
edges and a list of shadow volumes polygons; rendering said soft shadow edges into
one or more sides of a cubemap, rendering said shadow volume polygons in combi-
nation with a stencil buffer to detect full shadowed areas; from a viewer's point of
view rendering said scene with said cubemap applied while performing a stencil test
operation for preventing the scene to be drawn in shadowed areas, to produce a soft
15 shadowed image.

In addition, the system supports the re-use of the shadow volumes and cubemap in-
formation for more than one frame.
